SUBJECT INDEX

Actinomycetes, content of Bikini Atoll soils, 455.
Amino acids of protein material in muck soil, 245–252.
Amphibole content of acid volcanic rhyolite, 446.
Andesine, presence in clay soils of Java, 447.
Anion exchange, arsenate-displaceable phosphate, 371–378.
Antagonism—
  actinomycetes of Bikini Atoll, 453–458.
  properties of actinomycetes, 456.
Apparatus for collecting undisturbed samples, 399–401.
Aspartic acid, isolation and determination, 245.
Azotobacter—
  effects—
    crops under greenhouse conditions, 489–497.
    inoculation on nitrogen content and plant yields, 492–493.
  inoculation of crops, historical review, 413–429.
Bennett, Hugh Hammond (biographical note), 257.
Biotite, relation to growth of oil palms, 445.
Book reviews, *see* Books at end of letter B.
Bytownite, content of tropical soils, 445–451.

Wolf, F. T. *See* Wolf, F. A.

Capillary rise of moisture in field, as indicated by electrical resistance, 71–81.
Carbon—
  content of surface soils, 439.
  evolution of uronic, 442.
  relationship between total and uronic, 440.
Cation exchange capacity of Trinidad soils, 130.

Clay—
amberlite and bentonite, 216.
illite fraction, chemical composition, 136.
minerals of—
laterites, 9–12.
Trinidad soil, 135.
sedimentary, soil genesis from, 127.
Climate, Natal Coast, 85–86.
Conductivity, suspensions, 129.
Conservation—
benefits, 293.
Coastal Plains, 289.
crop rotations, 322.
development of national program, 259–274.
district, soil, 267.
drainage, 320.
dry-land farming, 350–352, 359.
Northern Great Plains region, 329–340.
Northeastern Region of United States, 275–288.
Pacific Region of United States, 353–364.
range land management, 324.
Southeastern Region of United States, 289–302.
Southwestern Region, 341–352.
specialized phases, 339.
Upper Mississippi Region, 303, 314.
water, 282, 296, 308, 337, 344, 355.
Western Gulf Region, 315–327.
Corn, zinc content of tissues, 31.
Decarboxylation—
factors influencing rates, 148–154.
plant material, 189.
rate of evolution of apparent uronic carbon, 186–187, 407.
rate of uronic groups in soil organic matter, plant gums, and microbial products, 183–198, 443.
Dehydration studies of Trinidad soils, 135–136.
Dolerites—
chemical composition, 90–95.
composition of Natal coastal, and alteration products, 85–96.
mechanical composition of soils formed on, 88.
Dye adsorption of gibbsite, 133.
Erosion—
classification and mapping, 270–272.
crop yields, 308.
irrigation, 344–347, 355.
measurement, 261, 306.
Erosion—(*continued*)
nutrient losses, 307.
range and forest lands, 347–350, 361.
sheet, 261.
streambank, 281.
watershed relations, 343.
wind, 281.
windbreaks, 326.
Exchangeable bases—
effect of mulching materials, 119–120.
of Trinidad soils, 130.
Fixation, effect of drying on phosphate, 381.
Genesis of soil from a sedimentary clay, 127–142.
Gibbsite, dye absorption by, 133.
Glutamic acid, isolation from soil organic matter, 246.
Grapes, radioactive phosphorus analysis, 20–21.
Hypersthene content of andesitic ash soils, 446.
Illite, composition of clay, 136.
Infiltration—
factors affection rates, 171–182.
fertilizers, 180.
organic mulch, 178.
Laterites—
chemical composition, 8–9.
of Southwestern Australia, 1–15.
Leucine isolation, 248.
by a common hydrometer, 389–398.
comparison of pipette methods, 393.
density and clay concentrations, 395.
effective particle diameter, 396.
Mechanism of ion release—
from soil particles to plants, 223–225.
transfer of ions, 223.
Methods—
acid-soluble and adsorbed phosphorus, extraction, 101.
collection and preservation of soil profiles, 61–69.
fractionation of organic nitrogen, 157–165.
isolation of bacteria-free cultures of protozoa, 97–100.
measurement of radioactivity, 17–28.
mechanical analysis of soils, 389–398.
mineral determinations in laterite, 3.
phosphorus-adsorbing capacity of soils, 199–212.
rapid chemical soil and plant tests, 227–244.

Microorganisms, effect on phosphate availability, 365.
Mineralogy of laterites, 7–12.
Minerals—
heavy, in podzols, 469–487.
in laterite, methods of determining, 13.
major and minor in podzols, 472–483.
tropic soils, 445-451.
stage of weathering, 447.
Moisture, capillary rise in field, 71–81; *see* also Infiltration.
Mulch, effect of materials on orchard soils, 111–125.
Mycorrhizae, relation to forest soils, review, 459–468.
Neubauer tests with podzol soils, 483.
Nitrates—
content of soils, 113.
effect of mulching materials on, in soils, 117.
influence in solution cultures on phosphorus content of citrus flowers, 51.
Nitrogen—
content of mulching materials, 113.
content of soils, 38.
increases in soil, from growing alfalfa on dry land, 37–45.
organic, in muck soils, 157–165.
recovery in alfalfa, 39.
sources, and phosphorus content of citrus flowers, 48–49.
Organic matter—
content of—
Bikini Atoll soils, 455.
podzol profiles, 471.
decarboxylation rates, 143–156.
Percolation rates, effect of mulches, 115.
Plant nutrition, tropical soils in relation to, 445–451.
Phosphorus—
adsorbing capacity of New Jersey soils, 199–212.
acid-soluble and adsorbed, of soils, 101–109.
and increases in cation exchange capacity, 209.
arsenate-displaceable in soils, 371–378.
available, 129.
content of citrus flowers, 47–59.
displaceable from plot soils, 376.
fixation studies with radioactive, 379–387.
immobilization in mineral fertilizers, 365–369.
organic phosphorus, 448–451.
Phosphorus—(*continued*)
penetration in soils, 25.
radioactive, *see* Radioactive isotopes.
retention by various soils, 382.
time and availability, 366.
total and soluble in grape vines, 24–25.
content of soils, 203.
Podzols—
content of—
organic matter, 471.
heavy minerals, 469.
Neubauer tests, 483.
Potassium, influence on phosphorus content of citrus, 52.
Profiles, collection and preservation, 61–69.
Protozoa, method of isolating bacteria-free cultures, 97–99.
Radioactive isotopes—
availability of phosphorus to grape vines, 17–28.
fixation studies with phosphorus, 379–387.
Rootstock, influence on phosphorus content of citrus flowers, 54–58.
Ross, William Horace (obituary), 167.
Snapbeans, zinc content, 33.
Soil series, analyses, descriptions of, or experiments with—
Aiken, 18; Amite, 380; Amity, 29; Annandale, 200; Bearden, 144, 186; Beaverton, 144, 186; Bermudian, 200; Bladen, 380; Brookston, 437; Brown, 437; Carrington, 144, 186, 403; Chehalis, 29; Chenango, 104; Chester, 202; Cheyenne, 152; Chicopee, 200; Chopaka, 62; Clarion, 144, 186, 427; Clinton, 144, 186; Collington, 200; Coloma, 113; Colts Neck, 200; Copake, 200; Coxville, 380; Dewey, 144, 186; Dunbar, 380; Dunmore, 427; Dutchess, 200; Eastport, 490; Emmet, 470; Ephrata, 68; Evesboro, 200, 490; Gainesville, 380; Gloucester, 144, 186; Grayling, 470; Hanford, 48; Hernando, 380; Hillsdale, 113, 427; Hoosic, 200; Houston, 144, 186; Kalkaska, 470; Lakewood, 200; Lawrenceville, 200; Leetonia, 144, 194; Leon, 380; Lisbon, 104; Miami, 113, 144, 186; Mohave, 144, 186; Nariva, 127; Newberg, 29; Nez Perce, 62; Norfolk, 144, 186, 380; Norton, 200; Olympic, 29; Ottawa, 217; Palmyra, 200, Palouse, 427; Plummer, 380; Portneuf, 144, 186; Powell, 29;

Soil series, analyses, descriptions of, or experiments with—(*continued*)
Putnam, 427; Rockaway, 200; Roselawn, 470; Rubicon, 470; Russell, 144, 186, 403; Sassafras, 200, 235; Selah, 62; Springdale, 62; Squires, 200; Talparo, 127; Wallace, 470; Webster, 427; Wheeling, 427; Whippany, 200; Williams, 144, 186; Wooster, 374; Yolo, 171.
Synthetic ion-exchange materials—
comparison of amberlite and bentonite clays as, 216.
factors influencing availability of plant nutrients from, 213–222.
Tests, rapid chemical soil and plant, 227–244.
Uronic acid—
and pectin, 143–156.
factors involved in decarboxylation rates of soil organic matter, 148.
Uronides—
decarboxylation rates of uronic units, 407.
influences of cropping and fertilizer practices on, 435–444.
separation, 403–411.
Zinc—
content of—
soils, 30.
plants, 31.
status of Oregon soils, 29–36.
